

The Danmar Skimmer-Jet

Are you tired of those stagnant spots in your pool where leaves and other debris accumulate and eventually sink, sticking you with a mess that's difficult to clean up?

Why Does That Happen?

They occur because traditional pool jets just aren't up to the task. Due to their low power, they just barely ripple the surface, and they only shoot straight forward, not creating any circular motion, so they just can't reach every part of the pool and move all debris to the filter.

A Solution to the Problem

Wouldn't it be so much nicer if you didn't have to deal with these hassles? What if your pool's circulation system could ensure that leaves and the like would end up at the filter, where they're easy to remove?

The new Danmar Skimmer-Jet is a patent-pending nozzle that's easy to install and provides strong, effective circulation. All you do is unscrew the existing pool nozzle, replace it with the Skimmer Jet, and reset the jet angle to 45° upward. Now you have powerful circulation that moves water rapidly along the sides of the pool, providing these results:

- It reaches places normal jet's can't.
- There won't be any stagnant places debris collects and sinks.
- Debris is swept around the pool to filters.

The Danmar Skimmer-Jet is also available directly to individual consumers and on a wholesale bulk-purchase basis to pool companies interesting in reselling it to clients.
